SMU SINGAPORE MANAGEMENT UNIVERSITY | School of Computing and Information Systems

CS621 Agentic AI for Intelligent Autonomy

Jean CHEN and DAI Bing Tian

{jeanchen, btdai}@smu.edu.sg

Project Specifications

Project (40%)

- Objective:
  - Consolidate what the course teaches
  - Demonstrate judgement, not just implementation
  - Produce something worth showing
- Project Team:
  - Expected to have 5 members per team, (-num_total_students)%5 teams of 4 members
  - Workload should be evenly distributed, peer evaluation at the end of the term
  - Form project team by Week 5
- Your system must operate at a defended autonomy level.
- Show what justifies it: a pass rate with variance, a baseline, the failure modes, and where the boundaries are.
- Supervised with strong evidence is preferred over delegated with none.

Submissions

- Project proposal
  - A slide deck of up to 6 pages, excluding the title page.
  - Problem definition
  - Objectives
  - Proposed autonomy level
  - Proposed datasets to be used
  - Proposed eval sets
  - All the above 5 items can be changed for the final project submission
  - Proposal is to make you start on agent design now
- Project – the final submission
  - A report of 4 pages, or a deck of 12 slides, excluding the title page.
  - Same 5 items: problem definition, objectives, autonomy level, datasets to be used, eval sets.
  - 2 additional items:
    - Agent evaluation
    - User experiences: how is the agent applied, who are the end users, and how does this agent change their life or work style?
  - Of course, the process of how you overcome challenges (ok if you didn't manually fix the issue, but how you identified the gaps?) is definitely worth writing about (and a great preparation for tech interviews).

Questions?

Thank You
